NEDO human CDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Biotechnology (RAB); CDNA library

Construction: Helix Research Institute (HRI) (supported by Japan

Key Technology Center etc.); 5- & 3'-end one pass sequencing: RAB,

HRI, and Biotechnology Center, National Institute of Technology and

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.

NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                       Quality coverage: 6.64 in Q20 bases; agarose-fp

continuent domain 12 (CARD-12) polypeptide. CARD domains are found in a number of proteins that transmit signals that activate apoptosis and inflammatory pathways in response to stress and other stimuli. Therefore, inflammatory pathways in response to stress and other stimuli. Therefore, CARD-12 and its corresponding nucleic acid may be used in treatment and diagnosis of patients suffering from disorders associated with an abnormal level (an increase or a decrease) of apoptotic cell death or abnormal activity of stress-related pathways. The disorders include cancer, viral infections (e.g. caused by poxviruses, adenoviruses), autoimmune disorders (e.g. Alzheimer's disease, amyotrophic lateral sclerosis), haematologic diseases (e.g. aplastic anemia, myocardial infarction, stroke), inflammatory and immune system disorders (e.g. crohn's disease, insulin-dependent diabetes, contact dermatitis, proteins), bacterial infections (e.g. tuberculosis, lepromatous leprosy), ischemmic and hypoxic brain damage, acute bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated caspase recruitment domain-12 polypeptide and nucleic acids encoding them, useful for treating and diagnosing disorders associated with abnormal apoptosis such as cancer, arthritis and Alzheimer's
ischaemia; reperfusion injury; acute bacterial meningitis; oxic brain damage; liver disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents a cDNA which encodes the human caspase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 3133 BP; 903 A; 691 C; 729 G; 810 T; 0 other;

The sequence represents a genomic DNA which encodes the human caspase recruitment domain 12 (CARD-12) polypeptide. CARD domains are found in a number of proteins that transmit signals that activate apoptosis and inflammatory pathways in response to stress and other stimuli. Therefore, CARD-12 and its corresponding nucleic acid may be used in treatment and diagnosis of patients suffering from disorders associated with an abnormal level (an increase or a decrease) of apoptotic cell death or abnormal activity of stress-related pathways. The disorders include cancer, viral infections (e.g. caused by poxyliuses, adenoviruses), autoimmune disorders (e.g. systemic lupus erythematosis, arthritis), neurological disorders (e.g. Alzheimer's disease, amyotrophic lateral sclerosis), haematologic diseases (e.g. aplastic anaemia, myocardial infarction, stroke), inflammatory and immune system disorders (e.g. Crohn's disease, insulin-dependent diabetes, contact dermatitis, postivate state and hypoxic brain injury, kidney maningly and injury, kidney maningly and injury, excitotoxic brain damage, acute bacterial
                                                                                                                                                                                                                                                                                           Isolated caspase recruitment domain-12 polypeptide and nucleic acids encoding them, useful for treating and diagnosing disorders associated with abnormal apoptosis such as cancer, arthritis and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ValGluGlnLeuThrLeuAsnGlyLeuLeuGlnAlaLeuGlnSerProCysIleIleGlu 168

The invention relates to an isolated caspase recruitment domain (CARD) containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain from it, and the polynucleotides encoding them. Also included are a recombinant vector comprising the polynucleotide, recombinant cells containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing containing the vector (e.g. bacteria, yeast, plant, animal, mammalian pathology characterised by abnormal cell proliferation (e.g. cancer), abnormal cell death (apoptosis), autoimmune diseases or inflammation. In particular, the polypeptide and nucleic acid are useful for treating containing a cartinocyte hyperplasia, inflammatory hyperplasia, fibrosis, smooth consciences in a cartinocyte proliferation in arteries following balloon angioplasty (restenosis).
                                                                                                                                                                                                                                                                                                                  Π
                                                                                                                                                                                                                                                                                                                                                                                                                      (restenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias, allergies, arthritis, lupus, Schrogen's syndrome, Crohn's disease, graft-versus-host disease, stroke, myocardial infarction, heart failure, neurodegenerative disease, prof. Parkinson's disease or Alzheimer's immunodeficiency associated disease (e.g. human immunodeficiency associated disease (e.g. human immunodeficiency virus (HIV) infection). The nucleic acids are useful in a variety of diagnostic applications. The present sequence is a cDNA encoding a CARD domain containing protein.

```
The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a CDNA
                                                                                                                                   3213

The present sequence encodes a human secreted polypeptide. The secreted polypeptides and polynucleotides are useful for treating nervous and muscular diseases, for inhibiting tumour formation and metastasis, for treating gastrointestinal ulceration, for preventing and treating diseases in spinal cord, thyroid gland, ovary, prostate, renal gland, small intestine, heart, trachea, thymus, lymph node, muscular system and colon, for treating lipase deficiency in cystic fibrosis and pancreatitis, for treating undesirable clot formation such as myocardial infarction, during angioplasty and all surgical procedures that require decreased blood clot formation, for treating immune disorders and microbial diseases, for treating immune disorders and microbial diseases, for refacting immune disorders, for treating inflammation and transplant rejection, for enhancing bone thickness and increasing bone density, for reducing the loss of essential ferroxidases, for suppressing apoptosis, and for regulating vascular smooth cell proliferation. They

AAM199166 to AAM199904 encode the human proteins given in AAM25225 to AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; antiagraph; haemostatic; uninerary; antiulcer; osteopathic; dematological; antiallargic; antiasthmatic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic;

antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, vairal, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, Parkinson's disease, neurodegenerative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       346

The invention relates to an isolated caspase recruitment domain (CARD) containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain from the polynucleotides encoding them. Also included are a recombinant vector comprising the polynucleotide, recombinant cells containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing and insect cells and an anti-CARD antibody. The CARD-containing and insect cells and an anti-CARD antibody or care useful for treating a pathology characterised by abnormal cell proliferation (e.g. cancer), abnormal cell death (apoptosis), autoimmune diseases or inflammation. In parthology characterised by abnormal cell proliferation in arteries following balloon angioplasty (restenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias, crestenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias, graft-versus-host disease, stroke, myocardial infarction, heart failure, neurodegenerative diseases (e.g. Parkinson's disease or Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, "autoimmune diseases or inflammation, e.g. carcinomas,

The invention relates to an isolated caspase recruitment domain (CARD) containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain from the polynucleotides encoding them. Also included are a recombinant vector comprising the polynucleotide, recombinant cells containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing polypeptide and CARD-encoding nucleic acid are useful for treating a pathology characterised by abnormal cell proliferation (e.g. cancer), abnormal cell death (apoptosis), autoimmune diseases or inflammation. In particular, the polypeptide and nucleic acid are useful for treating keratinocyte hyperplasia, inflammatory hyperplasia, fibrosis, smooth muscle cell proliferation in arteries following balloon angioplasty (restenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias, castenosis, juliomas, sarcomas, melanomas, leukaemias, graft-versus host disease, stroke, myocardial infarction, heart failure, neurodegenerative diseases (e.g. Parkinson's disease or Alzhelmer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, autoimmune diseases or inflammation, e.g. carcinomas,

The invention relates to an isolated caspase recruitment domain (CARD) containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain from it, and the polynucleotides encoding them. Also included are a recombinant vector comprising the polynucleotide, recombinant cells containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing polypeptide and CARD-encoding uncleic acid are useful for treating a pathology characterised by abnormal cell proliferation (e.g. cancer), abnormal cell death (apoptosis), autoimmune diseases or inflammation. In particular, the polypeptide and nucleic acid are useful for treating keratinocyte hyperplasia, inflammatory hyperplasia, fibrosis, smooth muscle cell proliferation in arteries following balloon angioplasty crestenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias, allergies, arthitis, lupus, Schrogen's syndrome, Crohn's disease, graft-versus-host disease, stroke, myocardial infarction, heart failure, neurodegenerative diseases (stroke, myocardial infarction, heart failure, immunodeficiency virus (HUV) infection). The nucleic acids are useful immunodeficiency virus (HUV) infection). The nucleic acids are useful in a variety of diagnostic applications. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, autoimmune diseases or inflammation, e.g. carcinomas, arthritis or stroke

AAA AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where cancer antigens. The colon cancer antigens have cytostatic activity and can be used in the prevention, cancer antigens have cytostatic activity and can be used in the prevention, cancer sasociated with decreased expression by rectifying mutations or deletions associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell contextment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the coresent invention.

Compared time of publication, meaning no sequences are present for missing at time of publication, meaning no sequences are present for capcer.

The invention relates to an isolated caspase recruitment domain (CARD)

containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain

from it, and the polyuciceotides encoding them. Also included are a
recombinant vector comprising the polyuciceotide, recombinant cells

containing the vector (e.g. bacteria, yeast, plant, animal, mammalian
and insect cells) and an anti-CARD antibody. The CARD-containing
and insect cells, and an anti-CARD antibody. The CARD-containing
colypeptide and CARD-encoding nucleic acid are useful for treating a
pathology characterised by abnormal cell proliferation (e.g. cancer),
abnormal cell death (apoptosis), autoimmune diseases or inflammation. In
particular, the polypeptide and nucleic acid are useful for treating
keratinocyte hyperplasia, inflammatory hyperplasia, fibrosis, smooth
muscle cell proliferation in arteries following balloon angioplasty
(restenosis), gliomas, carcinomas, sarcomas, melanomas, leukaemias,
allergies, arthritis, lupus, Schrogen's syndrome, Crohn's disease,
graft-versus-host disease, stroke, myocardial infarction, heart failure,
neurodegenerative diseases (e.g. Parkinson's disease or Alzheimer's
disease) or immunodeficiency associated disease (e.g. human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, autoimmune diseases or inflammation, e.g. carcinomas,

rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoasays e.g. radioimmunoasays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated immunosorbant assays (ELISA). Disorders which are diagnosed or treated immunosorbant assays (ELISA). Disorders which are diagnosed or treated immunosorbant disorders e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebral a disorders e.g. cardiac arrest, cerebral adsorders e.g. cardiac arrest, cerebral adsorders e.g. alzehim a disorders e.g. cardiac arrest, cerebral adsorders e.g. alzehim sand sonders e.g. corneal infection, and many other and sorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypetides can also be used as food additive or preservative to increase or decrease storage as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence encodes a novel secreted protein of the invention.
              New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                      encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  598

```
The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. candiac arrest, cerebroals rischaemia, anglogenesis, nervous system disorders e.g. cardiac arrest, cerebral disorders e.g. cardiac arrest, or himself disorders e.g. cardiac arrest, or himself disorders e.g. corneal infection, and many other and coular disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders e.g. checkets shin aging due to subburn, to maintain organs before, the prevent skin aging due to subburn, to maintain organs before
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence encodes a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID No 754; 980pp; English.

The invention relates to an isolated caspase recruitment domain (CARD) rontaining polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain from it, and the polymucleotides encoding them. Also included are a recombinant vector comprising the polymucleotide, recombinant cells containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and insect cells) and an anti-CARD antibody. The CARD-containing polypeptide and CARD-encoding nucleic acid are useful for treating a pathology characterised by abnormal cell proliferation (e.g. cancer), abnormal cell death (apoptosis), autoimmune diseases or inflammation. In
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, autoimmune diseases or inflammation, e.g. carcinomas,

pCMV-SPORT6; Site_1: Not1; Site_2: EcoRV (destroyed); RNA
source anonymous pool of 6 male brains, age range 23-27; 1
male lung, age 27; and 1 male testis, age 69. Library is
oligo-dT primed and directionally cloned (EcoRV site is
destroyed upon cloning). Average insert size 18 kb,
insert size range 1-3 kb. Library is normalized and
enriched for full-length clones and was constructed by C.
